

Product Description

ATEK251P4 is a wideband absorptive SP8T switch with low loss and high isolation. Frequency of operation starts from low frequencies close to DC, goes up to 12 GHz.

Operating from positive supply voltage and switch state is chosen by positive voltage control interface. Eliminates the need for external negative bias circuitry for the user.

RF input outputs are matched to 50 ohms internally. Switch is housed in a compact low cost 4x4 mm surface mount package.

Evaluation Board, bare die, custom package, and module options are available upon request.

Product Features

- Frequency Range: LF - 12 GHz
- Insertion Loss: 2 dB
- Positive Supply
- Positive Control
- IIP3: 45 dBm
- 4x4 mm compact size

Applications

- Wideband Receivers
- Telecommunication
- Test and Measurement
- Radar
- Electronic Warfare

Pin Description

Pin Number	Pin Name	Description
22	RFC	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
24	RF1	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
2	RF2	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
4	RF3	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
6	RF4	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
13	RF5	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
15	RF6	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
17	RF7	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
19	RF8	RF input/output pin. If the DC voltage level on RF lines is not equal to 0 V, an external DC block capacitor is required.
11	VDD	Vdd bias pin.
8	CTRLA	Control pin.
9	CTRLB	Control pin.
10	CTRLC	Control pin.
1, 3, 5, 7, 12, 14, 16, 18, 20, 21, 23	GND	Ground.
25	EPAD	Exposed Pad on the bottom of the package should be connected to ground with multiple number of vias to reduce the inductance to the GND.

Applications Information

Signal entering from RFC goes to RF1-8 depending on the switch state set by the user.

Vdd bias is 5 V and control voltages are CMOS compatible. Switch state can be set by switching control voltages between 0 V to 5 V. Operating the switch is done with positive voltage rails without the need for negative voltage levels.

Typical application schematic to operate the SP8T switch given below.

C1 is used to filter out the ripples and unwanted signals coming from the Vdd supply. Using additional capacitors in parallel to C1 will improve this filtering. If this filtering is of no concern, then SP8T can be operated without C1.

If needed, to filter out the ripples and unwanted signals on the external CTRL signals, a low pass filter in series R, shunt C configuration can be implemented on the CTRL lines. Note that external RC filtering limits the state switching speed of the SP4T.

CTRLA, CTRLB and CTRLC voltages are used for setting the switch state.

All datasheet plots are generated by a connectorized evaluation PCB with the application schematic provided above. Insertion Loss, Isolation and IP3 performance is measured with connectorized evaluation PCB. Then the loss of the PCB is de-embedded to generate the data presented in this document.

NC pins of the SP8T are connected to the GND on the EVB used to generate the plots shown in this document.

Absolute Maximum Ratings

Parameter	Value/Range
Supply Voltage (Vdd)	TBD
Control Voltages (CTRLA, CTRLB, CTRLC)	TBD
RF Input Power	TBD
Storage Temperature	-55 to +125°C

Operation of this device outside the parameter ranges given above may cause damage. These parameters should not be applied simultaneously.
